

Securing The Enterprise

Identity Management Automation

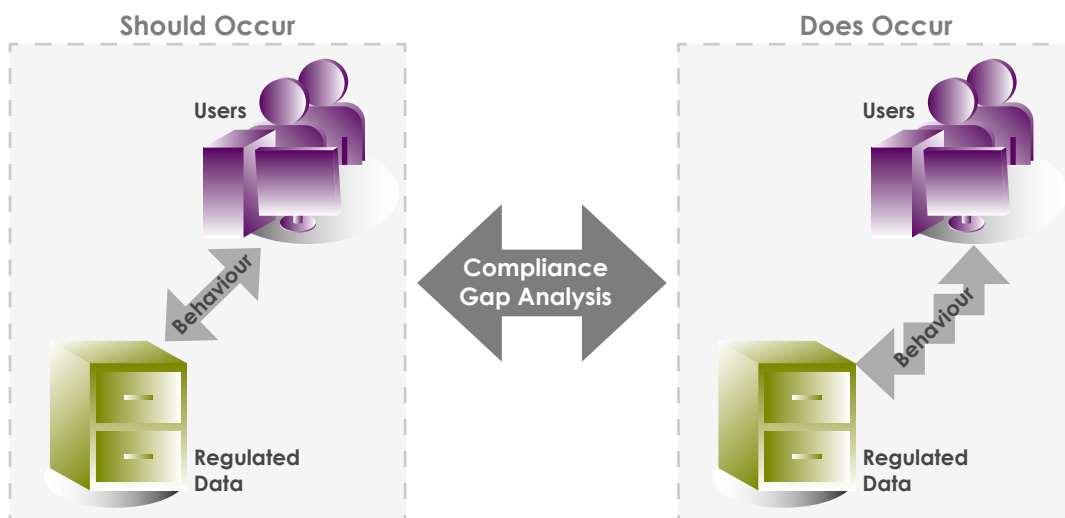

Business Challenges

Organisations today operate in the age of virtual enterprise, where communications and exchange of data with customers, employees, partners and suppliers in an elaborated collaborative chain stretches beyond traditional business boundaries.

Such a dynamic framework demands open access to business systems and data for all parties involved. The challenge faced by the organisations lies in controlling the way critical corporate information assets are accessed and shared while delivering high service level affordably.

This is where identity management can play a crucial role. Identity management involves identifying individuals within an enterprise network and controlling their access to information and applications in that network.

An effective identity management solution will enable an organisation to achieve the levels of integration, security, service and streamlined operations that the virtual enterprise demands. It also helps the organisation to address the challenges of regulatory compliance.

Key Highlights

- Provisioning of new users and Managing productivity
- De-provisioning of users
- Ensure compliance with corporate and legislative security policies
- Automate processes for granting/revoking access to IT resources

Our Solution Offerings:

Our solution is a suite of best-of-breed solutions:

→ Identity Manager

- Single point of security administration - provisioning and password management
- Identities and rights based on roles - profile management and identity synchronisation

→ Access Manager

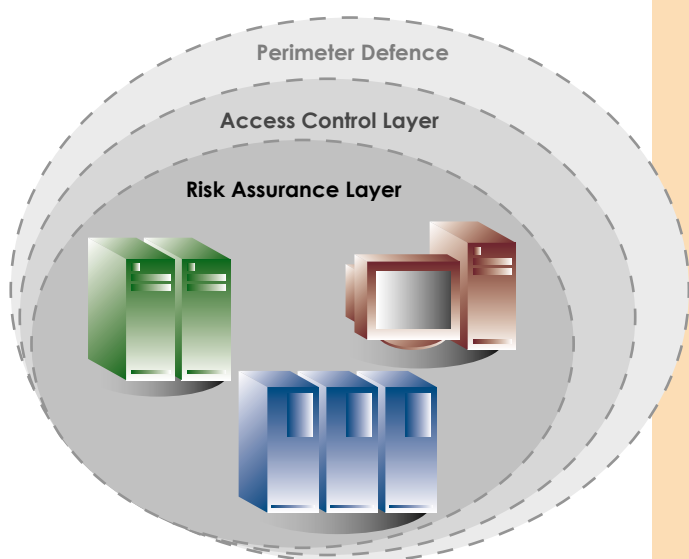

- Single access control point - access control
- Single sign-on

→ Risk manager

- Improving security by integrating management of events
- Firewalls, IDS, Web servers and OS
- Reduce the operating costs and hence improve operational efficiency

→ Compliance Manager

- Scan the enterprise for compliance for policies
- Assist in complying with legislative and governmental standards

Key Features

Implementation services

BT Frontline professional services work with you to customise the above solution to fit your business objective. Our consultants review your existing IT environment and security policies to create detailed requirements specifications specifying how BT Frontline will configure the identity management solution. This includes the plans for implementation and configuration of identity manager, access manager, risk manager and compliance manager. After the implementation is completed, BT Frontline consultants will conduct performance and validation testing to ensure that the security policies conform to the documented design. BT Frontline then provides the identity management solution overview and skills transfer to your system administrators or operators. You will also receive an operational runbook describing basic operating procedures.

BT Frontline also provides customised adaptors for integrating the identity management solution to your applications. BT Frontline utilizes the best practices to configure the system for maximum potential, helping you achieve the fastest time to production with reduced costs.

Activities and deliverables

Project kickoff meeting to establish the goals, schedules for the implementation

- Provides identity management design consulting to maximize the enterprise security and regulatory compliance
- Pre-planning and project kickoff
- Review and mapping of enterprise security policies to our solution
- Document the requirements specification with detailed statement of works
- Customised test procedure plan
- Installation and configuration of identity manager, access manager, risk manager and compliance manager
- Verify against documented test procedure plan to ensure conformance to the configuration design
- Provide configuration specific runbook and configuration reports
- Knowledge transfer of our identity management solution capabilities and operational procedures
- Conduct operational handover, with formal review of the project including the issues and implementation reports
